High Level System Architecture

Data Flows by Feature Groups

The below flows are intended to inform the transition of scope from the adapter to Recharge. Each arrow represents where webhooks/endpoints or other mechanisms are used to transfer data between the different systems.

As the feature group becomes a part of Recharge, the associated webhooks should no longer be created by both the adapter and Recharge, but just Recharge. The polling and other mechanisms to keep data in sync with the adapter can be retired.

Also, this should serve as a high level indicator of where Recharge may need to get data from BigCommerce or publish data to it, although additional details will be in the different feature group sections.
